

SmArt Designed Full Printed Flexible RObust Efficient Organic HaLide PerOvskite Solar Cells

LEITAT Technological Center

Silvia Colodrero

scolodrero@leitat.org

This event is organised by the CHEOPS project, which has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement no 653296.

Project objectives

1. Development of high efficiency (22%) sustainable PSC on flexible substrates at 1-10 cm² scale through:

- Advanced perovskite absorber development
- Advanced Electron and Hole Transport Materials development
- Light management strategies
- Development of an innovative design by modelling of PSC
- Antisoiling coatings:

Project objectives

2. Development of long lifetime flexible PSCs and module through:

- Long lifetime flexible PSC

- Advanced materials transporting layers development

- Novel low-cost encapsulation approach for PSC

- Innovative integral testing for flexible PSC

Project objectives

3. Development of sustainable and scalable printing processes for flexible PSC and modules using:

- High efficient flexible PS module

- Innovative low temperature process

- Innovative solvent engineering development

- Design and develop a complete recycling process for PSCs suitable for industrialization

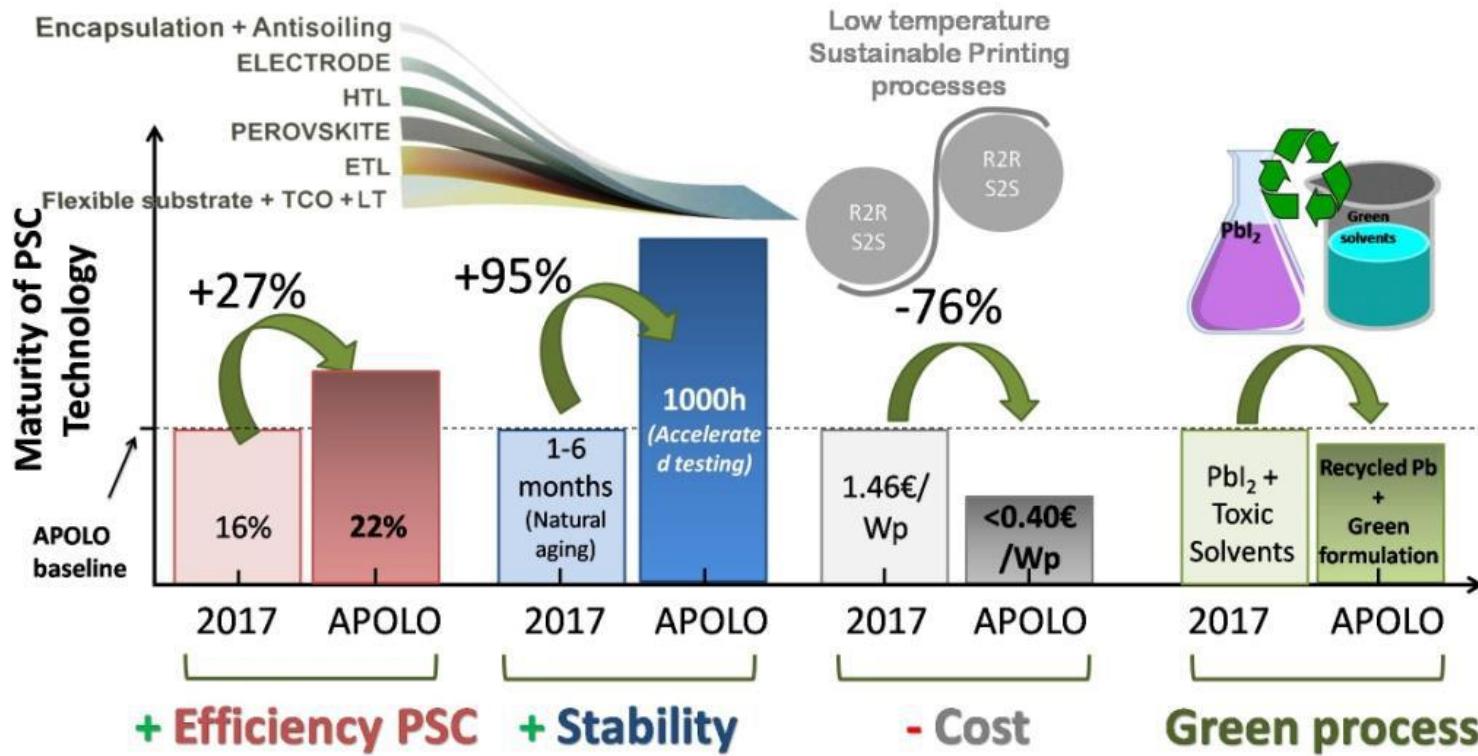

- Development of an innovative design by modelling of modules

- Development of a PSC integrated prototype Building Integrated PV applications

Project objectives

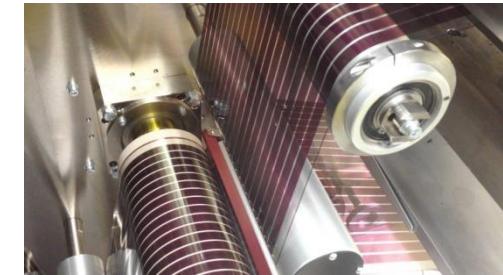

Open challenges

- High efficiency and high stability

- Scale up flexible devices with low temperature printing techniques

- Green and low cost production

- Dedicated recycling process

Open challenges

How ensure the acceptance of APOLO ...

- **Economical assessment for low cost PSC:** In order to guarantee PSC's market availability, APOLO will consider the cost of the materials and processes looking to reduce the cost in more than 50% (**0.34€/Wp**).

- **Standardization and common regulations assessment**

- **Environmental assessment: Life Cycle Assessment (LCA) and Life Cycle Cost (LCC) of the final solutions**

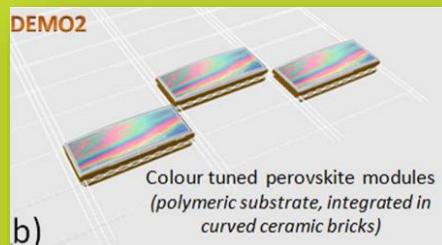

- **Social acceptance assessment.** Assessment of Social Risk Perception in order to identify main facilitators, barriers and opportunities for the technology from the social side.

Future applications

APOLO

b)

BIPV

Solar plants

Smart Cities

Beyond APOLO

Wearable

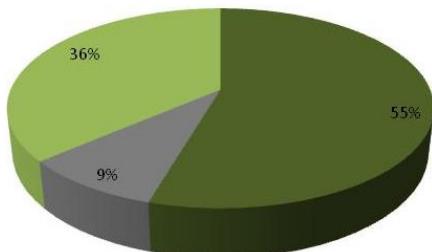

Transport
